## L I need to do more Date know **Objectives Tracker Sheet** Lesson this work on covered this well P10.1 Describe the structure of the atom, limited to the position, mass and charge of protons, neutrons and electrons. P10.2 Draw and use electric circuit diagrams representing them CP9a with the conventions of positive and negative terminals, and the Electric symbols that represent cells, including batteries, switches, voltmeters, ammeters, resistors, variable resistors, lamps, motors, circuits diodes, thermistors, LDRs and LEDs. P10.3 Describe the differences between series and parallel circuits. P10.4 Recall that a voltmeter is connected in parallel with a component to measure the potential difference (voltage), in volts, across it. CP9b Current and P10.7 Recall that an ammeter is connected in series with a component to measure the current, in amps, in the component. potential P10.10 Describe that when a closed circuit includes a source of difference potential difference there will be a current in the circuit. P10.11 Recall that current is conserved at a junction in a circuit. P10.5 Explain that potential difference (voltage) is the energy transferred per unit charge passed and hence that the volt is a joule per coulomb. P10.6 Recall and use the equation: CP9c Energy transferred (joule, J) = charge moved (coulomb, C) × Current. potential difference (volt, V) $E = Q \times V$ charge and P10.8 Explain that an electric current is the rate of flow of energy charge and the current in metals is a flow of electrons. P10.9 Recall and use the equation: charge (coulomb, C) = current (ampere, A) $\times$ time (second, s) $Q = I \times t$ Draw and use electric circuit diagrams [...] and the symbols that represent [...] resistors, variable resistors [...]. P10.12 Explain how changing the resistance in a circuit changes the current and how this can be achieved using a variable resistor. P10.13 Recall and use the equation: potential difference (volt, V) = current (ampere, A) $\times$ resistance (ohm, CP9d Ω) $V = I \times R$ Resistance P10.14 Explain why, if two resistors are in series, the net resistance is increased, whereas with two in parallel the net resistance is decreased. P10.15 Calculate the currents, potential differences and resistances in series circuits. P10.16 Explain the design and construction of series circuits for testing and measuring. P10.2 Draw and use electric circuit diagrams [...] and the symbols that represent cells, including batteries, switches, voltmeters, ammeters, resistors, variable resistors, lamps, motors, diodes, **CP9e** More thermistors, LDRs and LEDs. P10.18 Explain how current varies with potential difference for the about following devices and how this relates to resistance: resistance filament lamps а b diodes fixed resistors. С

## CP9: Electricity and Circuits (Paper 2)

CP9e Investigating energy   P10.19 Describe how the resistance of a light-dependent resistor (LDR) varies with light intensity.     P10.20 Describe how the resistance of a thermistor varies with change of temperature (negative temperature coefficient thermistors only).     P10.21 Explain how the design and use of circuits can be used to explore the variation of resistance in the following devices: a filament lamps b diodes c thermistors d LDRs.     CP9e Investigating resistance – Core practical   P10.17 Construct electrical circuits to: a investigate the relationship between potential difference, current and resistance for a resistor and a filament lamp b test series and parallel circuits using resistors and filament lamps.     P10.22 Recall that, when there is an electric current in a resistor, there is an energy transfer which heats the resistor.     P10.23 Explain that electrical current does work against electrical resistance     P10.24 Explain the energy transfer (in 10.22 above) as the result of collisions between electrons and the ions in the lattice.     P10.25 H Explain ways of reducing unwanted energy transfer through low resistance wires.     P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.     P10.27 Use the equation: energy transferred (joule, J) = current (ampere, A) × potential	
CP9e Investigating resistance   P10.21 Explain how the resistance of a thermistor varies with change of temperature (negative temperature coefficient thermistors only).     P10.21 Explain how the design and use of circuits can be used to explore the variation of resistance in the following devices: a filament lamps b diodes c thermistors d LDRs.   P10.21 Explain how the design and use of circuits can be used to explore the variation of resistance in the following devices: a filament lamps b diodes c thermistors d LDRs.     P10.21 Construct electrical circuits to: a investigate the relationship between potential difference, current and resistance for a resistor and a filament lamp core practical   P10.17 Construct electrical circuits using resistors and filament lamps.     P10.22 Recall that, when there is an electric current in a resistor, there is an energy transfer which heats the resistor.   P10.23 Explain that electrical energy is dissipated as thermal energy in the surroundings when an electrical current does work against electrical resistance     P10.24 Explain the energy transfer (in 10.22 above) as the result of collisions between electrons and the ions in the lattice.     P10.25 H Explain ways of reducing unwanted energy transfer through low resistance wires.     P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.     P10.27 Use the equation:	
CP9e P10.17 Construct electrical circuits to:   a investigating resistance of a resistor and a filament lamp   Core p10.17 Construct electrical circuits to:   a investigate the relationship between potential difference, current and resistance for a resistor and a filament lamp   b test series and parallel circuits using resistors and filament p10.22 Recall that, when there is an electric current in a resistor,   there is an energy transfer which heats the resistor. P10.23 Explain that electrical energy is dissipated as thermal energy   rtnew surroundings when an electrical current does work against electrical resistance   P10.24 Explain the energy transfer (in 10.22 above) as the result of collisions between electrons and the ions in the lattice. p10.25 H Explain ways of reducing unwanted energy transfer   P10.26 Describe the advantages and disadvantages of the heating effect of an electric current. p10.27 Use the equation:	
Investigating resistance – Core practical a investigate the relationship between potential difference, current and resistance for a resistor and a filament lamp b test series and parallel circuits using resistors and filament lamps.   P10.22 Recall that, when there is an electric current in a resistor, there is an energy transfer which heats the resistor.   P10.23 Explain that electrical energy is dissipated as thermal energy in the surroundings when an electrical current does work against electrical resistance   P10.24 Explain the energy transfer (in 10.22 above) as the result of collisions between electrons and the ions in the lattice.   P10.25 H Explain ways of reducing unwanted energy transfer through low resistance wires.   P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.	
CP9f P10.22 Recall that, when there is an electric current in a resistor, there is an energy transfer which heats the resistor. P10.23 Explain that electrical energy is dissipated as thermal energy in the surroundings when an electrical current does work against electrical resistance   CP9f P10.24 Explain the energy transfer (in 10.22 above) as the result of collisions between electrons and the ions in the lattice.   P10.25 H Explain ways of reducing unwanted energy transfer through low resistance wires. P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.   P10.27 Use the equation: P10.27 Use the equation:	
CP9f In the surroundings when an electrical current does work against electrical resistance P10.24 Explain the energy transfer (in 10.22 above) as the result of collisions between electrons and the ions in the lattice.   P10.25 H Explain ways of reducing unwanted energy transfer through low resistance wires. P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.   P10.27 Use the equation: P10.27 Use the equation:	
CP9f collisions between electrons and the ions in the lattice.   Transferring energy P10.25 H Explain ways of reducing unwanted energy transfer through low resistance wires.   P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.   P10.27 Use the equation:	
energy F10.25 H Explain ways of reducing unwalled energy transfer   through low resistance wires.   P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.   P10.27 Use the equation:	
P10.26 Describe the advantages and disadvantages of the heating effect of an electric current.    P10.27 Use the equation:	
difference (volt, V) × time (second, s) $E = I \times V \times t$	
P10.28 Describe power as the energy transferred per second and recall that it is measured in watts.	
P10.29 Recall and use the equation: power (watt, W) = energy transferred (joule, J)/time taken (second, s) $P = E/t$	
CP9g Power P10.30 Explain how the power transfer in any circuit device is related to the potential difference across it and the current in it.	
P10.31 Recall and use the equations: electrical power (watt, W) = current (ampere, A) × potential difference (volt, V) P = I × V electrical power (watt, W) = current squared (ampere2, A2) × resistance (ohms, $\Omega$ ) P = I2 × R	
P10.32 Describe how, in different domestic devices, energy is transferred from batteries and the a.c. mains to the energy of motors and heating devices.	
P10.33 Explain the difference between direct and alternating voltage.	
CP9h Transferring energy (d.c.). P10.34 Describe direct current (d.c.) as movement of charge in one direction only and recall that cells and batteries supply direct current (d.c.).	
P10.35 Describe that in alternating current (a.c.) the movement of charge changes direction.	
P10.36 Recall that in the UK the domestic supply is a.c., at a frequency of 50 Hz and a voltage of about 230 V.	

## KS4 Science: Electricity and Circuits

	P10.42 Describe, with examples, the relationship between the power ratings for domestic electrical appliances and the changes in stored energy when they are in use.		
CP9i Electrical safety	P10.37 Explain the difference in function between the live and the neutral mains input wires.		
	P10.38 Explain the function of an earth wire and of fuses or circuit breakers in ensuring safety.		
	P10.39 Explain why switches and fuses should be connected in the live wire of a domestic circuit.		
	P10.40 Recall the potential differences between the live, neutral and earth mains wires.		
	P10.41 Explain the dangers of providing any connection between the live wire and earth.
