

SC8: **Acids and Alkalis** (Paper 1)

| Lesson                             | Objectives Tracker Sheet  | Date covered | I know this well | I need to do more work on this |
|------------------------------------|---|--------------|------------------|--------------------------------|
| SC8a Acids, alkalis and indicators | C0.5 Describe the use of hazard symbols on containers<br>(a) to indicate the dangers associated with the contents<br>(b) to inform people about safe-working precautions with these substances in the laboratory. |              |                  |                                |
|                                    | C3.1 Recall that acids in solution are sources of hydrogen ions and alkalis in solution are sources of hydroxide ions.  |              |                  |                                |
|                                    | C3.2 Recall that a neutral solution has a pH of 7 and that acidic solutions have lower pH values and alkaline solutions higher pH values.   |              |                  |                                |
|                                    | C3.3 Recall the effect of acids and alkalis on indicators, including litmus, methyl orange and phenolphthalein.   |              |                  |                                |
|                                    | C3.4 <b>H</b> Recall that the higher the concentration of hydrogen ions in an acidic solution, the lower the pH; and the higher the concentration of hydroxide ions in an alkaline solution, the higher the pH.   |              |                  |                                |
| SC8b Looking at acids              | C3.5 <b>H</b> Recall that as hydrogen ion concentration in a solution increases by a factor of 10, the pH of the solution decreases by 1..  |              |                  |                                |
|                                    | C3.7 <b>H</b> Explain the terms dilute and concentrated, with respect to amount of substances in solution.  |              |                  |                                |
|                                    | C3.8 <b>H</b> Explain the terms weak and strong acids, with respect to the degree of dissociation into ions.  |              |                  |                                |
| SC8c Bases and salts               | C0.3 Write balanced equations, including the use of the state symbols (s), (l), (g) and (aq).   |              |                  |                                |
|                                    | C3.9 Recall that a base is any substance that reacts with an acid to form a salt and water only.  |              |                  |                                |

|  |  |  |  |  |
|--|--|--|--|--|
|  | C3.11b Explain the general reactions of aqueous solutions of acids with metal oxides to produce salts.   |  |  |  |
|  | C3.13 Describe a neutralisation reaction as a reaction between an acid and a base.   |  |  |  |
|  | C3.15 Explain why, if soluble salts are prepared from an acid and an insoluble reactant: excess of the reactant is added the excess reactant is removed the solution remaining is only salt and water. |  |  |  |
| SC8c Preparing copper sulfate – Core Practical     | Core practical.  |  |  |  |
| SC8d Alkalis and balancing equations               | C0.1 Recall the formulae of elements, simple compounds and ions.   |  |  |  |
|  | C0.2 Write word equations.   |  |  |  |
|  | C0.3 Write balanced chemical equations, including the use of the state symbols (s), (l), (g) and (aq).   |  |  |  |
|  | 3.10 Recall that alkalis are soluble bases.  |  |  |  |
|  | 3.11c Explain the general reactions of aqueous solutions of acids with metal hydroxides to produce salts.  |  |  |  |
| SC8d Investigating neutralisation – Core Practical | C3.6 Investigate the change in pH on adding powdered calcium hydroxide or calcium oxide to a fixed volume of dilute hydrochloric acid.   |  |  |  |
| SC8e Alkalis and neutralisation                    | 3.14 Explain an acid–alkali neutralisation as a reaction in which hydrogen ions (H <sup>+</sup> ) from the acid react with hydroxide ions (OH <sup>-</sup> ) from the alkali to form water.            |  |  |  |
|  | 3.16 Explain why, if soluble salts are prepared from an acid and a soluble reactant: titration must be used the acid and the soluble reactant are then mixed in the correct proportions                |  |  |  |

|  |   |  |  |  |
|--|---|--|--|--|
|  | the solution remaining, after reaction, is only salt and water.   |  |  |  |
|  | 3.18 Describe how to carry out an acid–alkali titration, using burette, pipette and a suitable indicator, to prepare a pure, dry salt.  |  |  |  |
| SC8f Reactions of acids with metals and carbonates | C0.4 <b>H</b> Write balanced ionic equations.   |  |  |  |
|  | 3.11 Explain the general reactions of aqueous solutions of acids with (a) metals and (d) metal carbonates to produce salts.   |  |  |  |
|  | 3.12 Describe the chemical test for (a) hydrogen and (b) carbon dioxide (using limewater).  |  |  |  |
| SC8g Solubility                                    | C3.19 Recall the general rules which describe the solubility of common types of substances in water:<br>a all common sodium, potassium and ammonium salts are soluble<br>b all nitrates are soluble<br>c common chlorides are soluble except those of silver and lead<br>d common sulfates are soluble except those of lead, barium and calcium<br>e common carbonates and hydroxides are insoluble except those of sodium, potassium and ammonium. |  |  |  |
|  | C3.20 Predict, using solubility rules, whether or not a precipitate will be formed when named solutions are mixed together, naming the precipitate if any.  |  |  |  |
|  | C3.21 Describe the method used to prepare a pure, dry sample of an insoluble salt.  |  |  |  |
