SC9: Quantitative chemistry

## Lesson sequence

1. Formula masses
2. Calculating empirical formulae
3. Conservation of mass
4. Calculating reacting masses
5. Moles (HT)
6. Stoichiometry of reactions (HT)

| 1. Formula masses |  |
| :--- | :--- |
| Molecular <br> formula | Gives the number of atoms of each <br> element present in a molecule. |
| Empirical <br> formula | Gives the number of atoms of each <br> element present in a compound as the <br> simplest whole number ratio. |
| Converting <br> molecular <br> to <br> empirical <br> formulae | Divide the number of each atom by <br> the highest common factor of all of <br> the atoms. |
| Molecular <br> to <br> empirical <br> formula <br> examples | $\mathrm{C}_{2} \mathrm{H}_{4} \rightarrow \mathrm{CH}_{2}($ divided by 2) <br> $\mathrm{C}_{6} \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{O}_{6} \rightarrow$ CH $\mathrm{H}_{2} \mathrm{O}$ (divided by 1 ) by 6) |
| Relative <br> atomic <br> mass, $\mathbf{A}_{\mathbf{r}}$ | The mass of an atom relative to $1 / 12^{\text {th }}$ <br> the mass of carbon-12. No units. |
| Relative <br> formula <br> mass, $\mathbf{M}_{\mathbf{r}}$ | The mass of one unit of a formula, <br> found by adding the relative atomic <br> masses of all of the atoms in it. |

## Worked examples W1

Calculate the $M_{r}$ of carbon dioxide $\left(\mathrm{CO}_{2}\right)$.

$$
\begin{aligned}
& =A_{r}(C)+\left(2 \times A_{r}(O)\right) \\
& =12+(2 \times 16)
\end{aligned}
$$

So, $\mathrm{Mr}_{\mathrm{r}}$ of $\mathrm{CO}_{2}=44$

## Relative Formula Mass - RFM

The Relative Formula Mass $\left(\mathrm{M}_{\mathrm{r}}\right)$ of a compound is the sum of the relative atomic masses of all its elements added together.

In order to calculate the RFM of a compound you must know the formula and the RAM's of each of the atoms involved ( $\mathrm{H}=1, \mathrm{O}=16$ ).

Example: Find the $\mathrm{M}_{\mathrm{r}}$ of water, $\mathrm{H}_{2} \mathrm{O}$
Step 1: Write the formula
Step 2: Substitute the $A_{r}$ 's

Step 3: Add them up to get the $\mathrm{M}_{\mathrm{r}}$
$1+1+16=18$

| $\mathrm{H}=1$ | $\mathrm{C}=12$ | $\mathrm{~N}=14$ | $\mathrm{O}=16$ | $\mathrm{Na}=23$ | $\mathrm{Mg}=24$ | $\mathrm{Al}=27$ |
| :--- | :--- | :--- | :--- | :---: | :--- | :--- |
| Hydrogen | Carbon | Nitrogen | Oxygen | Sodium | Magnesium | Aluminium |
| $\mathrm{P}=31$ | $\mathrm{~S}=32$ | $\mathrm{Fe}=56$ | $\mathrm{Cu}=63.5$ | $\mathrm{Cl}=35.5$ | $\mathrm{Ca}=40$ |  |
| Phosphorous | Sulphur | Iron | Copper | Chlorine | Calcium |  |

Using the method shown and the $\mathrm{A}_{\mathrm{r}}$ 's above calculate the $\mathrm{M}_{\mathrm{r}}$ 's for the following:

| 2. Calculating empirical formulae |  |
| :---: | :---: |
| To calculate <br> empirical <br> formulae <br> from <br> experimental <br> data | - Write each element's symbol with a ratio (:) symbol between - Write out the amount of each element from the questions <br> - Divide each amount by the $\mathrm{A}_{\mathrm{r}}$ of the element <br> - Divide each answer by the smallest answer to get a ratio - Write the empirical formula |
| To find a molecular formula from an empirical formula | - Calculate $\mathrm{M}_{\mathrm{r}}$ for the empirical formula <br> - Divide the $\mathrm{M}_{\mathrm{r}}$ of the molecular formula by this number <br> - Multiply the empirical formula by your answer |

| Symbol for element | Ca | Cl |
| :--- | :--- | :--- | :--- |
| Mass (g) | 10.0 | 17.8 |
| Relative atomic mass, $\mathrm{A}_{\mathrm{r}}$ | 40 | 35.5 |
| Divide the mass of each element by its <br> relative atomic mass | $\frac{10.0}{40}=0.25$ | $\frac{17.8}{35.5}=0.5$ |
| Divide the answers by the smallest <br> number to find the simplest ratio | $\frac{0.25}{0.25}=1$ | $\frac{0.5}{0.25}=2$ |
| Empirical formula | $\mathrm{CaCl}_{2}$ |  |

## 1) 4 g of Titanium reacting with 1 g of <br> Carbon <br> ( $\mathrm{Ti}=48, \mathrm{C}=12$ )

$\qquad$
$\qquad$
$\qquad$
empirical formula $=$ $\qquad$
2) 1.12 g of Iron reacting with 0.48 g of

Oxygen
$(\mathrm{Fe}=56, \mathrm{O}=16)$
$\qquad$
$\qquad$

## Empirical formula

Empirical formula - is the simplest formula which represents the ratio of atoms in a compound. There is one simple rule to follow: always divide the data you are given by the $\mathrm{A}_{\mathrm{r}}$ of the element. Then simplify the ratio to give you the simplest formula.

Example: Find the empirical formulae of an oxide of hydrogen, produced by reacting 1 g of hydrogen with 8 g of oxygen

Step 1: Write down the relative atomic masses of the elements involved - $\mathrm{A}_{\mathrm{r}}$ of $\mathrm{H}=1$ and $\mathrm{A}_{\mathrm{r}}$ of $\mathrm{O}=16$
Step 2: Divide the masses given in the question by the $\mathrm{A}_{\mathrm{r}}$ 's of the elements -
$\mathrm{H}=1 / 1=1: \mathrm{O}=8 / 16 \quad=\quad 0.5$
Step 3: Identify the ratio of atoms in the compound and simplify it, the easiest way to do this is to divide both sides by the smallest number and then make sure both sides are whole numbers-
$1 / 0.5 \quad: 0.5 / 0.5 \quad=\quad 2: 1$
Step 4: Convert your answer to the empirical formula, by substituting the numbers for the atomic symbols and adding the required number, representing the number of atoms, after the symbol $-2: 1=\mathrm{H}_{2} \mathrm{O}$

## empirical formula $=$

3) 0.31 g of Phosphorous reacting with 1.07 g of Chlorine $\quad(\mathrm{P}=31, \mathrm{Cl}=35.5)$
$\qquad$
$\qquad$
$\qquad$
empirical formula $=$ $\qquad$
4) 6 g of Magnesium reacting with 4 g of Oxygen
$(\mathrm{Mg}=24, \mathrm{O}=16)$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

| 3. Conservation of mass |  |
| :--- | :--- |
| Conservation <br> of mass | The total mass of products <br> must equal the total mass of <br> reactants. |
| Precipitation <br> reaction | A reaction that produces a <br> solid precipitate by mixing <br> two solutions. |
| Closed system | A system in which no <br> chemicals can enter or leave, <br> such as a sealed test tube. |
| Open system | A system in which chemicals <br> can enter or leave - such as <br> an open test tube. |
| Conservation <br> of mass in a <br> closed system | No atoms are able to enter or <br> leave, so the total mass stays <br> the same - for example a <br> precipitation reaction in a <br> closed flask. |
| Conservation <br> of mass in an <br> open system | For example, a carbonate <br> reacting with acid producing <br> CO bubbles: the mass <br> appears to decrease because <br> you can't weigh the gas that <br> goes into the air, however it <br> is still there. |

| 3. Concentration |  |
| :--- | :--- |
| Concentration | The amount of a solute <br> dissolved in a certain <br> volume of solvent. |
| Calculating <br> concentration <br> $\left(\mathbf{g} / \mathbf{d m}^{-3}\right)$ | Mass of solute $(\mathrm{g})$ <br> Volume of solution $\left(\mathrm{dm}^{3}\right)$ |
| Decimetre <br> $\left(\mathbf{d m}^{3}\right)$ | A unit of volume equivalent <br> to $1000 \mathrm{~cm}^{3}$, to covert from <br> $\mathrm{cm}^{3}$ to dm <br> volume by 1000. |

To work out concentrations you need to know the following formula:

$$
\text { Concentration }\left(\text { mol dm}{ }^{-3}\right)=\frac{\operatorname{mass}(g)}{\text { volume of solution }\left(\mathrm{dm}^{-3}\right)}
$$

You also need to know that $1 \mathrm{dm}^{3}=1000 \mathrm{~cm}^{3}$, which means that to convert to $\mathrm{cm}^{3}$ to $\mathrm{dm}^{3}$ you should divide by 1000 .
Work out the concentrations (in $\mathrm{g} / \mathrm{dm}^{-3}$ ) of the following solutions:

1. 20 g of $\mathrm{NH}_{3}$ in $500 \mathrm{~cm}^{3}$
2. 10 g of $\mathrm{Br}_{2}$ in $2000 \mathrm{~cm}^{3}$
3. 18 g of NaOH on $300 \mathrm{~cm}^{3}$

Work out the mass of the solute in the following solutions
4. $250 \mathrm{~cm}^{3}$ of a $200 \mathrm{~g} / \mathrm{dm}^{-3}$ solution of $\mathrm{Ca}(\mathrm{OH})_{2}$
5. $50 \mathrm{~cm}^{3}$ of a 0.5 M solution of $\mathrm{HNO}_{3}$

B The total mass of the reactants always equals the total mass of products.

Use the balanced equations to answer the following questions.

1) 12.4 g of copper carbonate was heated and formed 8.0 g of copper oxide. Calculate the mass of carbon dioxide produced.
$2 \mathrm{CuCO}_{3}(\mathrm{~s}) \rightarrow 2 \mathrm{CuO}_{(\mathrm{s})}+\mathrm{CO}_{2}(\mathrm{~g})$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
2) 1.27 g of copper was heated in air and formed 1.59 g of copper oxide. Calculate the mass of oxygen that reacted with the copper.

$$
2 \mathrm{Cu}_{(\mathrm{s})}+\mathrm{O}_{2(\mathrm{~g})} \rightarrow 2 \mathrm{CuO}_{(\mathrm{s})}
$$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

| 4. Calculating reacting masses |  |
| :--- | :--- |
| Excess <br> reactant | Any reactant which is not used up <br> completely in a reaction because <br> there is more of it than needed. |
| STRERTON |  |
| SCHOOL |  |,\(\left|\begin{array}{l}Any reactant of which is <br>

completely used up in a reaction. <br>
The limiting reactant determines <br>
how much product is made.\end{array}\right|\)

## Triple Science - Chemistry

## Calculating the mass of a product

Sometimes, we need to be able to work out how much of a substance is produced in a chemical reaction.
Example: What mass of hydrogen is produced by the electrolysis of 4 g of water?
Step 1: Write down the balanced equation, and underline the substances mentioned in the question:
$\underline{\mathbf{2 H}_{2} \mathrm{O}} \rightarrow \quad \underline{\mathbf{2 H}_{2}}+\quad \mathrm{O}_{2}$

Step 2: Work out the relative formula mass $\left(\mathrm{M}_{\mathrm{r}}\right)$ of each substance:

$$
2 \times((2 \times 1)+16) \rightarrow \quad 2 \times(2 \times 1) \quad+\quad(2 \times 16)
$$

Step 3: Since the question only mentions water and hydrogen, you can ignore the oxygen. You just need the ratio of mass of $\mathrm{H}_{2} \mathrm{O}$ to mass of $\mathrm{H}_{2}$ :

So, $\quad 36 \mathrm{~g}$ of water produces 4 g of hydrogen.
1 g of water produces $\quad(4 \div 36) \mathrm{g}$ of hydrogen $\quad$ (Divide both sides by 36)
4 g of water produces
$(4 \div 36) \times 4 \mathrm{~g}$ of hydrogen
$=0.44 \mathrm{~g}$ of hydrogen

## Worked example

Calculate the mass of chlorine needed to make 53.4 g of aluminium chloride.

| Write the balanced eq | $2 \mathrm{Al}+3 \mathrm{Cl}_{2} \rightarrow 2 \mathrm{AlCl}_{3}$ |
| :---: | :---: |
| Calculate relative formula masses of the substances needed | $\begin{aligned} & \mathrm{M}_{\mathrm{r}} \mathrm{Cl}_{2}=2 \times 35.5=71 \\ & \mathrm{M}_{\mathrm{r}} \mathrm{AlCl}_{3}=27+(3 \times 35.5)=133 . \end{aligned}$ |
| Calculate ratio of masses (multiply $M_{r}$ values by the balancing numbers shown in the equation). <br> $3 \mathrm{Cl}_{2}$ makes $2 \mathrm{AlCl}_{3}$ <br> so $3 \times 71=\underline{213} \mathrm{~g} \mathrm{Cl}_{2}$ makes $2 \times 133.5=\underline{267} \mathrm{~g} \mathrm{AlCl}_{3}=$ |  |
| Work out the mass for 1 g of react the product because that's the ma $\begin{array}{ll} \div 267 & \frac{213}{267} \mathrm{~g} \mathrm{Cl}_{2} \\ & 0.798 \mathrm{~g} \mathrm{Cl}_{2} \end{array}$ | or product. (Here we want 1 g of we know already.) <br> es $\frac{267}{267} \mathrm{~g} \mathrm{AlCl}_{3}$ $\div 267$ <br> es $1 \mathrm{~g} \mathrm{AlCl}_{3}{ }^{1}$ |
| Scale up or down (from 1 g to the mass you are given) |  |

Q1) What mass of aluminium is produced from 100 tonnes of aluminium oxide?
$(\mathrm{Al}=27, \mathrm{O}=16)$
$2 \mathrm{Al}_{2} \mathrm{O}_{3} \quad \rightarrow \quad 4 \mathrm{Al}+3 \mathrm{O}_{2}$

Q2) What mass of ethanol $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ is produced from the reaction of 14 tonnes of ethane $\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)$ ?

$$
(\mathrm{C}=12, \mathrm{H}=1, \mathrm{O}=16)
$$

$\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})$
$+\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
$\rightarrow \quad \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}_{(1)}$

| 5. Moles (HT) |  |
| :--- | :--- |
| Moles | The unit of measurement of <br> chemicals - one mole of any chemical <br> is the same amount. |
| One mole | An amount of a chemical such that <br> one mole has a mass in grams that is <br> the same as its relative formula mass. |
| Avogadro's <br> constant | $6.02 \times 10^{23}:$ the number of <br> atoms/molecules present in one mole <br> of a substance. |
| Calculating <br> moles from <br> mass | Quantity in moles = mass / relative <br> formula mass |
| Calculating <br> moles from <br> a number <br> of particles | Quantity in moles = number of |
| particles / 6.02 x $10^{23}$ |  |\(\left|\begin{array}{l}Calculating <br>

the <br>
number of <br>
particles <br>
from a <br>
mass of <br>

substance\end{array} \quad $$
\begin{array}{l}\text { formula mass) x } 6.02 \times 10^{23}\end{array}
$$\right|\)| fumber of particles $=($ mass / relative |
| :--- |

## Worked example W2

10.8 g of a luminium reacted with 42.6 g of chlorine, $\mathrm{Cl}_{2}$, to produce aluminium chloride, AlCl, Deduce the balanced equation for the reaction.

|  | Al | $\mathrm{Cl}_{2}$ |
| :--- | :--- | :--- |
| Calculate the number of moles <br> (= mass/A or M. $)$ | $\frac{10.8}{27}=0.4$ | $\frac{42.6}{2 \times 35.5}=0.6$ |
| Divide by the smaller | $\frac{0.4}{0.4}=1$ | $\frac{0.6}{0.4}=1.5$ |
| Simplest whole number ratio | $1 \times 2=2$ | $1.5 \times 2=3$ |

So 2 mol of A l react with 3 mol of $\mathrm{Cl}_{2}$. The equation is completed by adding the formula of the product and balancing in the normal way.

$$
2 \mathrm{Al}+3 \mathrm{Cl}_{2} \rightarrow 2 \mathrm{AlCl}
$$

1 Calculate the number of moles of water molecules, $\mathrm{H}_{2} \mathrm{O}$, in 9 g of water

Calculate the number of moles of ethanol molecules, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$, in 9.2 g of ethanol.

2 Calculate the mass of 2.5 mol of potassium iodide, KI
$\qquad$

Calculate the mass of 0.125 mol of calcium sulfate, $\mathrm{CaSO}_{4}$.

$$
\text { Avagadro's constant }=6.02 \times 10^{23}
$$

1 Calculate the number of molecules in 0.5 mol of carbon dioxide, $\mathrm{CO}_{2}$
$\qquad$

Calculate the number of molecules in 2 mol of oxygen, $\mathrm{O}_{2}$.
$\qquad$

2 Calculate the number of moles in $1.505 \times 10^{23}$ atoms of sodium
$\qquad$

Calculate the number of molecules in $1.806 \times 10^{24}$ atoms of copper.
$\qquad$
3 Calculate the number of molecules in 9 g of hydrogen, $\mathrm{H}_{2}$
$\qquad$

Calculate the number of molecules in 48 g of oxygen, $\mathrm{O}_{2}$.

| 6. Stoichiometry (HT) |  |
| :--- | :--- |
| Stoichiometry | $\begin{array}{l}\text { The ratio of the number } \\ \text { of moles of each } \\ \text { substance involved in a } \\ \text { reaction. }\end{array}$ |
| $\begin{array}{l}\text { Stoichiometric } \\ \text { coefficient }\end{array}$ | $\begin{array}{l}\text { The 'big' numbers } \\ \text { written in a balanced } \\ \text { equation. }\end{array}$ |
| $\begin{array}{l}\text { Deducing } \\ \text { stoichiometry }\end{array}$ | $\begin{array}{l}\text { - Calculate the number of } \\ \text { moles present of each of } \\ \text { the reactants (or } \\ \text { products) }\end{array}$ |
| - Find the simplest |  |
| whole-number ratio |  |
| - Balance in the normal |  |
| way to find the numbers |  |
| of products (or reactants) |  |$\}$

## Worked example W1

1.50 g of ammonium chloride and 4.00 g of calcium hydroxide are heated together to form ammonia.

$$
2 \mathrm{NH}_{4} \mathrm{Cl}+\mathrm{Ca}(\mathrm{OH})_{2} \rightarrow 2 \mathrm{NH}_{3}+\mathrm{CaCl}_{2}+2 \mathrm{H}_{2} \mathrm{O}
$$

a Which is the limiting reactant?
b Calculate the mass of ammonia formed.
a The equation shows that 2 mol of $\mathrm{NH}_{4} \mathrm{Cl}$ reacts with 1 mol of $\mathrm{Ca}(\mathrm{OH})_{2}$ number of moles of $\mathrm{Ca}(\mathrm{OH})_{2}=4.00 \mathrm{~g} /(40+2(16+1))=0.0541 \mathrm{~mol}$

We need: $2 \times 0.0541=0.108 \mathrm{~mol} \mathrm{NH}_{4} \mathrm{Cl}$ to react with 0.0541 mol of $\mathrm{Ca}(\mathrm{OH})_{2}$. We have: $1.50 \mathrm{~g} /(14+(4 \times 1)+35.5)=0.0280 \mathrm{~mol}$

We have less than the 0.0541 mol of $\mathrm{NH}_{4} \mathrm{Cl}$ needed; $\mathrm{NH}_{4} \mathrm{Cl}=$ limiting reactant.
b The equation shows that the number of moles of $\mathrm{NH}_{3}$ made equals the number of moles of $\mathrm{NH}_{4} \mathrm{Cl}$ used. So, 0.0280 mol of $\mathrm{NH}_{4} \mathrm{Cl}$ forms 0.0280 mol of $\mathrm{NH}_{3}$ mass of $\mathrm{NH}_{3}$ formed $=\mathrm{mol} \times \mathrm{M}_{\mathrm{r}}=0.0280 \times(14+(3 \times 1))=0.476 \mathrm{~g}$

$$
\mathrm{Mg}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{MgSO}_{4}+\mathrm{H}_{2}
$$

1. Identify the stoichiometric ratio between magnesium and sulphuric acid in the reaction above.
2. If 5 moles of magnesium is reacted with 7 moles of sulphuric acid, which reagent is in excess? How many moles of each product is formed?

$$
\mathrm{Fe}_{2} \mathrm{O}_{3}+3 \mathrm{CO} \rightarrow 2 \mathrm{Fe}+3 \mathrm{CO}_{2}
$$

3. Identify the stoichiometric ratio between iron oxide and carbon monoxide in the reaction above.
4. If 480 tonnes of iron oxide is reacted with 308 tonnes of carbon monoxide, which reagent is in excess? How many moles of each product is formed?
5. 2.76 g sodium reacts with 5.70 g titanium chloride, $\mathrm{TiCl}_{4}$ to form titanium and sodium chloride, NaCl . Use this data to deduce the balanced equation for the reaction.

Relative atomic masses:
$\mathrm{Na}=23 \quad \mathrm{Cl}=35.5 \quad \mathrm{Ti}=48$
2. $\mathrm{TiCl}_{4}+2 \mathrm{Mg} \rightarrow \mathrm{Ti}+2 \mathrm{MgCl}_{2}$

What mass of Titanium (Ti) can be made when 1.9 g of Titanium chloride $\left(\mathrm{TiCl}_{4}\right)$ reacts with 6 g of magnesium $(\mathrm{Mg}$ ?
$\qquad$
$\qquad$
$\qquad$
3. $\mathrm{WO}_{3(\mathrm{~s})}+3 \mathrm{H}_{2(\mathrm{~g})} \rightarrow \mathrm{W}(\mathrm{s})+3 \mathrm{H}_{2} \mathrm{O}_{\text {(1) }}$

What mass of Tungsten (W) can be made when 23.2 g of Tungsten oxide $\left(\mathrm{WO}_{3}\right)$ reacts with 20 g of hydrogen $\left(\mathrm{H}_{2}\right)$ ?
$\qquad$
$\qquad$
$\qquad$
$\qquad$
