## SP8: Energy – Forces Doing Work (Paper 2) SP9: Forces and their Effects (Paper 2)

| Lesson                                  | Objectives Tracker Sheet   | Date<br>covered | l know<br>this well | I need to do<br>more work<br>on this |
|---|--|-----------------|---------------------|--------------------------------------|
| SP8a Work and power                     | P8.1 Describe the changes<br>involved in the way energy is<br>stored when systems change   |                 |                     |                                      |
|   | P8.4 Identify the different ways<br>that the energy of a system can<br>be changed:   |                 |                     |                                      |
|   | a through work done by forces<br>b in electrical equipment<br>c in heating.  |                 |                     |                                      |
|   | P8.5 Describe how to measure<br>the work done by a force and<br>understand that energy<br>transferred (ioule 1) is equal to            |                 |                     |                                      |
|   | work done (joule, J).<br>P8.6 Recall and use the   |                 |                     |                                      |
|   | equation: work done (joule, J) =<br>force (newton, N) × distance<br>moved in the direction of the<br>force (motro, m) $E = E \times d$ |                 |                     |                                      |
|   | P8.7 Describe and calculate the<br>changes in energy involved<br>when a system is changed by<br>work done by forces.                   |                 |                     |                                      |
|   | P8.12 Define power as the rate<br>at which energy is transferred<br>and use examples to explain<br>this definition.                    |                 |                     |                                      |
|   | P8.13 Recall and use the<br>equation: power (watt, W) =<br>work done (joule, J) $\div$ time taken<br>(second, s), P = E/t.             |                 |                     |                                      |
|   | P8.14 Recall that one watt is equal to one joule per second, J/s.  |                 |                     |                                      |
| SP9a Objects<br>affecting each<br>other | P9.1 Describe, with examples,<br>how objects can interact:<br>a at a distance without<br>contact, linking these to the                 |                 |                     |                                      |
|   | gravitational, electrostatic and<br>magnetic fields involved<br>b by contact, including<br>normal contact force and friction           |                 |                     |                                      |
|   | c producing pairs of forces<br>which can be represented as<br>vectors  |                 |                     |                                      |

|                           |   | 110 1 1 | eo ana men i | 11100 |
|---------------------------|---|---------|--------------|-------|
|                           | P9.2 Explain the difference<br>between vector and scalar<br>quantities using examples.  |         |              |       |
| SP9b Vector<br>diagrams   | H Use vector diagrams to<br>illustrate resolution of forces, a<br>net force, and equilibrium<br>situations (scale drawings only).   |         |              |       |
|                           | <b>H</b> Draw and use free body force diagrams.   |         |              |       |
|                           | H Explain examples of the<br>forces acting on an isolated<br>solid object or a system where<br>several forces lead to a resultant<br>force on an object and the<br>special case of balanced forces<br>when the resultant force is zero. |         |              |       |
| SP9c Rotational<br>forces | P9.6P Describe situations where forces can cause rotation.  |         |              |       |
|                           | P9.7P Recall and use the<br>equation: moment of a force<br>(newton metre, N m) = force<br>(newton, N) × distance normal to<br>the direction of the force (metre,<br>m).   |         |              |       |
|                           | P9.8P Recall and use the<br>principle of moments in<br>situations where rotational<br>forces are in equilibrium: the<br>sum of clockwise moments = the<br>sum of anti-clockwise moments<br>for rotational forces in<br>equilibrium.     |         |              |       |
|                           | P9.9P Explain how levers and gears transmit the rotational effects of forces.   |         |              |       |
